#### PRICING METHODOLOGY 2025-2026

## 1. Introduction

Top Energy Limited (Top Energy) is the electricity distribution network in the Mid and Far North of the Northland region. The network distributes 325,000,000 kWh of electricity to 34,500 electricity consumers who own the company through the Top Energy Consumer Trust (TECT).

This pricing methodology document describes our key considerations and approach to setting distribution prices effective 1 April 2025. It also sets out our plans and pricing strategy.

The pricing methodology is structured as follows:

- Section 2 summarises our approach and key decisions for setting prices in 2025-26
- Section 3 summarises key considerations we have considered in making decisions on pricing.
- Section 4 details our principles and objectives, recent review, and plans and strategy for pricing.
- Section 5 to 7 provides further detail on how prices are set, including:
  - how target revenue is determined
  - key decisions on consumer groups and available pricing options
  - how target revenue is allocated to each consumer and price option including for price signals
- Appendix 1 provides director certification of this pricing methodology.
- Appendix 2 provides a glossary of common terms used in this document.
- Appendix 3 maps compliance against section 2.4 of the ID Determination
- Appendix 4 describes how this pricing methodology is consistent with the Electricity Authority's pricing
  principles published in June 2019. It also shows outlines our progress on their current ten areas of focus.
- Appendix 5 details distribution prices that will apply from 1 April 2025
- Appendix 6 shows current and forecast Utilisation of the network by substation.

# 2. Summary of how prices are set

## 2.1. Process for setting prices

The following diagram illustrates Top Energy's process for reviewing and setting prices in 2025-26

#### **Business Considerations**

We have considered asset management, operations, commercial, and financial matters in setting pricing, as well as our consumer ownership.

#### **Consumer Views**

We have consulted with consumers and community organisations understand their views on pricing and quality of supply matters.

#### Regulatory **Considerations**

We have considered applicable pricing and information disclosure regulations and guidance including the EA areas of

#### **Objectives**

We have developed and refined a set of principles and objectives to guide our pricing decisions.

#### Strategy

alignment

requirements

**Pricing Review** We have reviewed existing

pricing structures and considered a range of alternative options, taking into account the above considerations objectives,

and

industry

future

We have revised our plan and strategy to continue to transition to more efficient pricing structures over a 5year period.

#### 2026 Target Revenue

We have determined 2026 target revenue based on recovery of costs, limited to the regulated revenue cap we are subject to.

#### Communicate and monitor

We have published our 2026 prices and pricing methodology. We will continue to monitor developments and adjust our strategy as required.

#### Consult

We have consulted with Retailers on the 2026 Pricing changes and structural changes. We will consult consumers and retailers on our wider pricing strategy as work progresses.

#### 2026 Prices

Target revenue is allocated to consumer groups and options pricing determine 2026 prices based on setting cost reflective pricing signals (where needed) consumer groups and then the recovering the residual.

#### 2026 Consumer **Groups and Pricing Options**

We have implemented the fourth year of phasing out the Low Fixed Charge Tariff and further increased fixed charges. Both have further increased our fixed cost recovery.

## 2.2. How prices are calculated

Prices have been set to recover our 2025-26 target revenue. Target revenue is calculated to recover our forecast costs and is limited by a revenue cap determined by the Commerce Commission. This year is the first under DPP4. This revenue covers the cost of our local electricity distribution network and pass-through costs (including Transmission, levies and rates). Unit prices (comprising a daily fixed charge and/or a consumption-based variable charges and /or capacity charges) are calculated for each pricing option we offer by allocating target revenue:

- directly to a consumer, where costs are known for specific consumer groups.
- based on revenue from price signaling if applicable and
- using cost allocators for shared costs, which are based on consumer numbers or usage characteristics.

Figure 1 illustrates how target revenue is allocated to consumer groups and prices.

Figure 1: Calculation of prices

Notes: UM: Unmetered, IND: Industrial, DG: Distributed Generation

Top Energy's prices are used to charge electricity retailers in the Far North. Electricity retailers determine how to package these charges together with energy, metering and other costs when setting retailer prices that are charged.

#### PRICING METHODOLOGY 2025-2026

## 2.3. Key changes to prices in 2025-26

We have continued focusing on our pricing methodology and built on previous reforms implemented as outlined in our roadmap.

#### The key highlights over the last five years are:

- Implementation of Residential and General Commercial TOU prices from 1 April 2020.
- Implementation of capacity and demand pricing for our large TOU Commercial customers from 1 April 2021.
- Implementation of a distributed generation export variable charge of 0.5c/kWh to cover incremental costs from 1 April 2021. This was increased to 1c/kWh in 2023.
- New Price Code for DG >1MW for incremental costs for Distribution System Operation from 1 April 2022.
- Implementation of the phase-out of the LFCT regulations from 1 April 2022. This is ongoing.
- Updating of the 5-year pricing strategy in 2022.
- Basing peak prices on LRMC and commenced reducing off-peak rates from 1 April 2023
- Migrating all eligible connections to TOU pricing with no exemptions on 1 April 2024.

After significant changes since 2020, there are no changes to our pricing structures this year. This year's focus is on increasing the efficiency of the existing pricing through continuing the phasing in cost-reflective pricing, including increasing fixed charge recovery and lowering off-peak prices.

#### The key changes in 2025-2026 are:

- Transition to new revenue regulatory period (DPP4 2026 to 2030)
- Continue the phase-out of the LFCT for residential customers. From 1 April 2025, the daily charge on all Low User Residential pricing categories will increase to 75 c/day. This is the maximum allowed in the fourth year of the phase-out. Top Energy intends to continue to phase out the LFCT, as per the regulations, over the next two years, accelerating our move to cost-reflective pricing through higher fixed cost recovery
- Increasing Fixed charge recovery from 39% to 43% and lowering off-peak charges
- No longer directly billing Industrial consumers from 1 April 2025.

The discount paid by Top Energy will continue to be a posted discount and included in the price schedule. This is based on consumption over the pricing year and will be paid in May 2026.

Distribution prices have increased by 13.3% on average, including the posted discount. This results in revenue being \$0.2M below the Forecast allowable revenue permitted under the revenue cap regulation. These increases will be applied across all consumer groups except Industrial and Large Generation. Industrial (IND) consumers will continue to be assessed based on specific assets used. Overall headline prices have increased by 13.9%, accounting for all pass-through and recoverable costs but before the discount. Appendix 5 provides further details on prices.

## 3. Pricing considerations

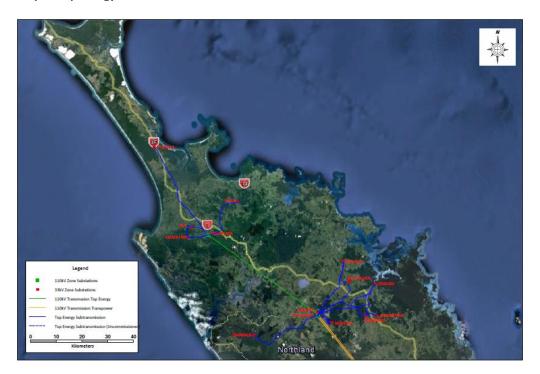

## 3.1. Business considerations

#### 3.1.1 Background - Our Network

Top Energy is the local electricity distribution network in the Mid and Far North of the Northland region. Top Energy's network begins in Hukerenui, approximately 25km north of Whangarei and ends at Te Paki, 20 km south of Cape Reinga. It spans from the East Coast to the West Coast. The supply area is sparsely populated with no dominant urban centre and is recognised as one of the more economically depressed areas of the country.

The company is an integral part of the Far North community. It is owned by its customers through TECT. Consumer trust ownership means that surpluses not required for the operation and development of the network are returned to consumers via lines discounts on electricity bills and through a dividend from TECT. Top Energy also employs more than 155 people and is one of the largest employers in the Far North.

Figure 2: Map of Top Energy's Network

The network receives supply from the national grid at the Kaikohe substation and from local geothermal generation at Ngawha. From early 2024 the network also receives supply from a solar farm in Kaitaia. A second solar farm is due to connect in Kaitaia in early 2025. The Kaikohe substation supplies the southern part of the network directly, with the northern part of the network supplied from a single transmission circuit to Kaitaia. Electricity is then distributed to consumers across long distribution feeders supplied from a limited number of zone substations. To improve quality of supply and maintain supply for planned outages for Kaitaia, over 15MW of Diesel generators have been installed just outside the township.

#### PRICING METHODOLOGY 2025-2026

This configuration is a legacy of a network design focused on providing electricity to a sparsely populated, economically deprived area, at a time when cost rather than reliability was the main driver for network development. Over 35% of Top Energy's lines were originally built using subsidies provided by the Rural Electrical Reticulation Council (RERC). This levy assisted post-war farming development in remote areas and enabled the supply of electricity to consumers located in sparsely populated rural areas, which would otherwise have been uneconomic to service.

The original network infrastructure was also developed at a time when Kaikohe and Kaitaia were the dominant urban centres. This is no longer the case, with growth subsequently occurring in the Bay of Islands and Kerikeri as well as the East Coast peninsulas.

Many existing lines now require extensive rebuilding and refurbishment. Many assets are located in sparsely populated rural areas which remain uneconomic in some circumstances. However, Top Energy is required by legislation to maintain a power supply to consumers that were connected to these lines prior to 1993.

Within this environment, Top Energy has had to invest to meet growth in new areas, while maintaining an appropriate level of service in existing high-cost network areas. The costs of these investments need to be reflected in prices.

#### 3.1.2 Network consumption and peak demand

The utilisation of the network is heavily weighted towards small consumers, representing 99% of connections and over 80% of maximum demand. This is evidenced by the fact that average consumption is one of the lowest in the country at approximately 10,000kWh/consumer. Top Energy's pricing structures are therefore, strongly focused on the needs of the Residential and General consumer groups, with only a few large connections. The total energy sold on the network is shown below and has fallen over the last two years after being stable in the preceding three years.

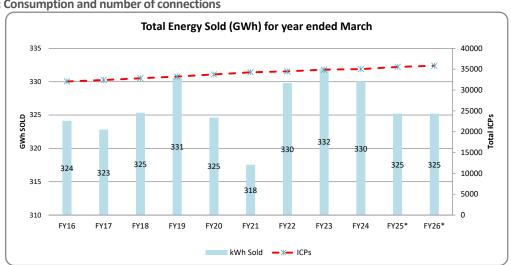

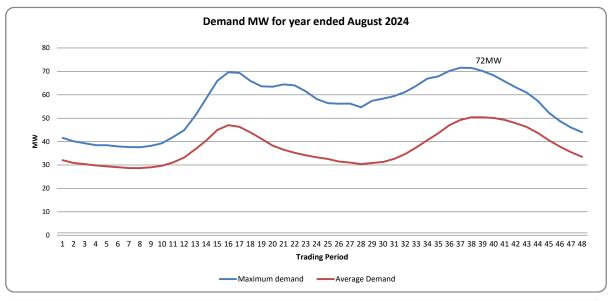

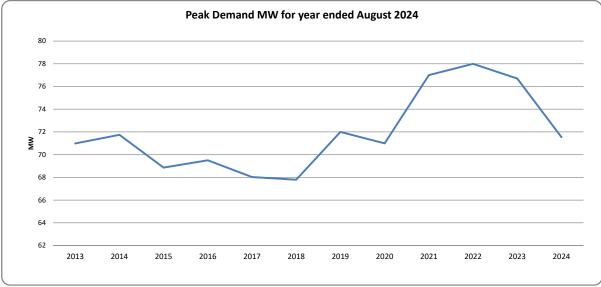

Figure 3: Consumption and number of connections

#### PRICING METHODOLOGY 2025-2026

The key driver for future investment in the network is maximum demand in aggregate and substation level. Maximum demand on the network was approximately 72MW down from 77MW in 2023. The fall in peak demand is in line with the fall in consumption and was driven, in part, by a warmer winter, harder economic conditions and the stressed wholesale market.

Figure 4: Demand on Top Energy network

## 3.1.3 Current Constraints and responding to future congestion

No major capacity constraints exist on the sub-transmission 33kV network when all network elements are in service. However, our Asset Management Plan has signalled that additional load growth would result in the load at risk continuing to increase and therefore more difficult to mitigate. This assessment is based on the utilisation of our

#### PRICING METHODOLOGY 2025-2026

network by substation. Appendix 6 shows current and forecast (5 year) utilisation of the network by substation and implications e.g. future congestion. A five-year period has been considered as it balances delivery time to address potential issues with uncertainty of future network demands.

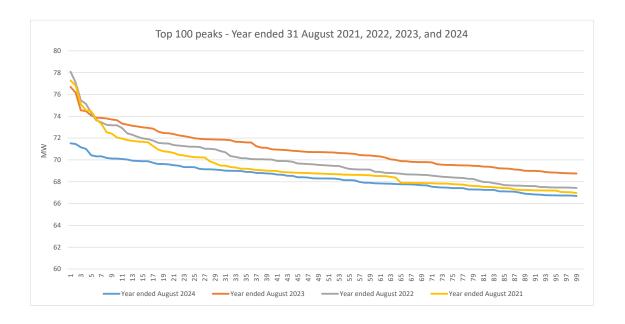

The most pressing capacity constraint on the network is on the lower voltage network (11kV and less), which is typically at street and suburb level. These constraints are predominately in rural areas but also include some urban areas. To date, it has been hard to assess the impact on the LV network as we don't have access to voltage information from smart meters. We have an ongoing trial looking at addressing this. Future growth in demand on these lines may require additional investment. This can be managed through increasing the capacity, non-network solutions, and optimisation of existing assets or smoothing demand through price signals.

Despite currently experiencing limited capacity constraints, Top Energy has introduced TOU pricing for Residential and Commercial consumers as congestion is sufficiently proximate. By offering price signals now this will enable retailers to build the appropriate systems and offer TOU price structures to customers and for customers to become accustomed to these future price structures as peak demand management is required. To date no change in behaviour has been seen due to very limited pass-through to end customers. To further embed these price signals Top Energy has removed retailer exemptions and migrated all eligible customers with capable meters to TOU pricing. Periodic reviews are completed to ensure that connections remain on the correct pricing. Price signals for demand management will continue to be refined, e.g., more targeted, and this could include further trials.

These price signals have become increasing important with the removal of peak demand transmission pricing (RCPD) and the removal of Avoided Cost of Transmission (ACOT) payments from 1 April 2023. Without these signals Distribution Generation in our network has no incentive to generate when demand is high e.g. winter nights and consumers will have less incentive to reduce demand.

An initial review of the impact of the removal of RCPD was completed last year. This clearly showed that peak demand increased under the new TPM. This has been updated for 2024. The graph below shows the Top100 peaks for the year ended August 2021 to 2024. This shows a significant decrease in maximum peak demand over the last year, and that the top 100 peaks have fallen to 2021 levels. This was partly due to the warmer winter. Demand response due to tight wholesale market conditions and tighter economic conditions could have also contributed. Given the variability displayed, we will continue to monitor this and the impact on our demand forecasts.

#### PRICING METHODOLOGY 2025-2026

## 3.2 Industry Context

Decarbonisation and the emergence of new technologies are expected to have a significant impact upon the traditional electricity industry, not only increasing demand but also changing customers' use of the network and, in some cases, providing alternatives to grid connection. Emerging technologies include:

- Distributed generation e.g. Photovoltaic generation
- Battery storage and management systems
- Household Management Systems and
- Electric Vehicles

The overall combined impact of these technologies is uncertain; however, the impact of technology will have a direct effect on our pricing structures, and we need to ensure that network utilisation can be maximised. Electrification of existing industrial processes will be limited as we only have two Industrial customers with little energy transition required. Future Industrial growth will be evaluated on an individualised basis.

Top Energy is committed to implementing good pricing practices that encourage efficient network use and investment for the long-term benefit of our consumers. This includes moving towards cost reflective pricing and closely aligning with the Electricity Authority's guidance. This is a reform across New Zealand that has the objective to increase utilisation of the network and lowering future costs meaning lower line charges. Figure 5 below describes this in more detail.

#### PRICING METHODOLOGY 2025-2026

Figure 5: Cost reflective pricing principle

#### Signal future network costs

- At peak electricity demand times, set prices that reflect the cost of adding network capacity to meet growing demand
- At times of low demand where there is spare significant spare capacity, set low prices

# **>>>**

Customers pay less using the network off-peak. This incentives more usage out of the peak and lowers investment pressure, which lowers costs for everyone longer term.

#### 2. Allocate residual costs

- Prices that signal future costs of meeting new demand won't recover enough revenue to meet today's fixed costs
- Recover residual costs through prices designed to avoid deterring usage, or creating cross subsidies between different types of consumers

The fixed costs of the network are recovered in a way that is fair and doesn't discourage off-peak usage.

Our 5-year pricing strategy was updated to reflect this further and continues to be refined. Network implications and opportunities are under investigation, with the initial focus on distributed generation and electric vehicles. A Distribution System Operator has been employed to assist in managing this.

#### 3.2.1 Distributed Generation

The network has the third highest penetration of small solar in the country, at 6.6% of connections (2,272 customers with installed capacity of 13.7MW). This is 20% higher than a year ago, and growth is expected to continue. This excludes a large distribution generation of 32MW.

The key immediate issue with solar is localised clustering e.g. at street level especially in the Eastern part of the network. A high penetration of solar within a street or suburb results in voltage issues and potential capacity constraints. To date this has been managed with the existing infrastructure but the future impact on the network requires investigation and management. It is anticipated that the increasing prevalence of exporting distributed generation will drive long term incremental costs on the network through demand for additional capacity, initially in the low voltage network.

Top Energy has a distribution generation charge of 1 c/kWh which is unchanged. The revenue recovered seeks to recover some of the incremental costs of investigating issues, developing solutions and other administration costs. These costs only relate to additional costs due to distributed generation rather than additional network infrastructure costs.

Our first large-scale solar (32MW) connected in the Kaitaia region in November 2023. The next solar farm (23MW) is due to be connected in April / May 2025. Larger scale Distributed Generation, for the purpose of export, is expected to cause capacity constraints at all levels in the future and this includes the national transmission grid. Currently Top Energy has approved applications for 67MWA for solar around Kaitaia. Given the maximum possible export capacity of the Kaikohe to Kaitaia 110 kV line circuit is 66MVA, Top Energy will no longer approve applications unless upgrades are financially supported. In addition, there are potential transmission constraints on Kaikohe and Maungatapere 110kV line with Top Energy having approved applications for 132MVA with several other interested parties showing interest and at various stages of discussion. To accommodate these applications Top Energy is working with Transpower on a

#### PRICING METHODOLOGY 2025-2026

low cost run back scheme with the costs to be recovered by new connecting generation. However, even with this upgrade, it is anticipated that the remaining capacity will be allocated in the short term. Top Energy has been working with Transpower and Northpower on options to accommodate further generation in Northland.

#### 3.2.2 Battery trial

Batteries could assist in the management of the network especially at peak demand. A battery trial with a third party started in 2023 with the aim to understand the potential and how effectively the technology can be utilised. The battery was installed at Taipa in December 2023 which was chosen as it is operating at capacity and is requiring reinforcement and use of distributed generation (diesels). This is still to be commissioned and has provided some good learnings.

#### 3.2.3 Electric Vehicles

Electric Vehicles have the potential to change consumption patterns e.g. peak demand and are also a consideration for network management. We currently have around 472 EVs (BEV, PHEV as of October 2024), up from 350, registered within our network area and are not seeing any network issues. However, we do acknowledge the actual number using our network is higher due to a high level of tourists visiting the district. As uptake increases, we do expect to see isolated constraints appearing which will require additional price signals to manage demand. However, the lack of pass-through from retailers of current price signals, e.g., TOU prices, could limit our ability to signal this and result in higher investment than otherwise required.

## 3.3 Consumer views

#### 3.3.1 Price and Quality

To inform our decisions regarding the above investments, in 2009 Top Energy consulted with consumers on our proposed network developments and consumer expectations for prices and the quality of service they receive. The survey results established that 80% of consumers wished to see network reliability improve. Accordingly, we embarked on a programme to improve security of supply in which \$180 million would be spent over 10 years, the single largest expansion in the history of the network.

In 2022, Top Energy consulted customers again regarding their price and quality perspectives. This was done through a separate survey of 1,000 consumers. This was repeated in November 2024 and the results were consistent with the 2022 survey. The key findings were:

- Six out of ten customers (64%) consider Top Energy's current power supply reliability to be acceptable (compared to 68% in 2022), with over one-third (35%) stating that the power supply has improved over the last 12 months.
- A significant proportion of customers (79%) would not be prepared to pay more for an improved level of power supply (compared to 81% in 2022).

#### PRICING METHODOLOGY 2025-2026

Over eight of ten of customers (81%) agree to move from a high cost to a low-cost company by 2030 would
require reliability of supply to remain at the current level. This is up from 74% in 2022.

These results are consistent with our annual survey, which measures current satisfaction with price and quality. Feedback from the last five surveys indicates that both Residential and Commercial consumers are generally satisfied with the current levels of service, with the majority not willing to pay higher prices for increased reliability. The 2024 customer survey results are shown below.

Figure 6: Price quality trade-off

Source: Key Research customer survey 2024

#### 3.3.2 Customer satisfaction

Since 2018, Top Energy has completed comprehensive annual telephone satisfaction surveys to understand Residential and Commercial customer satisfaction and experience with the services provided. In addition, we complete monthly customer surveys which measure customer satisfaction with our faults and new connections divisions.

The key results were:

- Customer satisfaction with faults and new connections divisions remains strong and has averaged 80% over the last 12 months
- Adoption of New technologies by customers remains similar 2023 with Commercial customers more inclined
  to adopt new technologies than Residential customers. This included electric vehicles, solar and batteries. The
  number of customers likely to purchase an EV in the next 12 months fell from 14% to 9%. This is due to the
  removal of the subsidy and the introduction of road user charges.

Only 10% of customers said that they changed power companies in the last 12 months, and 20% of customers said that they used the Powerswitch website to determine the best power company. These are down from last year's 12% and

#### PRICING METHODOLOGY 2025-2026

26%, respectively. Surveys will continue to be completed to provide a benchmark of customer satisfaction and preferences over time.

## 3.2. Regulatory considerations

Top Energy is subject to regulations that influence our pricing decisions as well as provide guidance on how prices should be set. These are summarised in Figure 7.

The Commerce Commission determines the lines charge revenue it considers sufficient to recover our reasonable costs and appropriate return on investment. This is outlined in the Default Price-Quality Path Determination 2025 (DPP4). The 2025/2026 year is the first year of DPP4. We must also publish a range of information on our prices and pricing methods. This pricing methodology is prepared pursuant to these requirements (see Appendix 3).

The Electricity Authority's (EA) pricing principles and information disclosure guidelines also provide useful guidance on setting economically efficient prices. The EA published pricing principles (June 2019), and Updated Practical notes V2.1 (2022), and we have considered the extent to which our pricing methodology aligns with these pricing principles in Appendix 4.

To encourage and support distributors to adopt more efficient distribution prices the EA developed and published scorecards for each distributor based on an assessment of their pricing methodology and pricing roadmap. The last scorecard was completed for the 2023/24 year as the Authority decided not to produce them based on the 2024/25 year. In addition to scorecards, the Authority has published 10 focus areas for distribution pricing. These are outlined in Appendix 4, which shows our progress to date.

Top Energy scored 4.1 / 5 in 2023/2024, a significant increase from the 2021 score of 3.3 / 5. This placed Top Energy in the top 35% of all distribution companies in New Zealand, which reflects our pricing reform to date on cost-reflective pricing and our future pricing strategy. Despite the scorecard, Top Energy will continue to align our pricing strategy with our pricing objectives e.g. not differentiate between rural and urban customers, as this is based on consumer feedback.

The scorecard assessment is aimed to complement industry-led efforts to promote more efficient distribution pricing, by analysing different pricing options, and offering frameworks and tools. The EA assessments will be repeated periodically to track progress, identify good practices, and provide constructive feedback where progress lags.

#### PRICING METHODOLOGY 2025-2026

Figure 7: Summary of relevant regulations

Regulation	How this affects Top Energy's prices
Electricity Distribution Services Default Price- Quality Path Determination 2020 (DPP)	Forecast revenue from prices must not exceed forecast allowable revenues determined by the Commerce Commission
Section 2.4 of the Electricity Distribution Information Disclosures Requirements (ID)	Requires Top Energy to publish certain information on prices and pricing methods
Distribution Pricing Principles and Information Disclosure Guidelines (Pricing Principles)	<ul> <li>Provides guidance on:</li> <li>economic principles and market considerations for setting prices.</li> <li>information that should be made available to support pricing methodologies</li> </ul>
The Electricity (Low Fixed Charges Options for Domestic Consumers) Regulations 2004 (LFC Regulations) and The Electricity (Low Fixed Charges Options for Domestic Consumers) Amendment Regulation 2021	This requires Top Energy to offer a price option to domestic consumers that has a fixed daily price not exceeding 75 cents for the 1 April 2025 to end of 31 March 2026 period. Over 5 years this can increase by 15 c/day each year to 90c /day for 1 April 2026 to end of 31 March 2027. Thereafter, the regulation is revoked.
The Electricity Industry Participation Code, Part 6 - pricing of distributed generation.	Limits prices for distributed generation to the incremental costs of connecting generation to the network, considering any avoided costs.
The Electricity Industry Participation Code, Part 12A.	Top Energy must consult with retailers in relation to any changes to pricing structures.

## 3.3. Stakeholder (Retailer) considerations

In accordance with the requirements of the Electricity Industry Participation Code, Top Energy has engaged with all retailers that have connections to our Network when we have intended to make changes to our pricing structures.

During September and October 2024, Top Energy, in conjunction with Northpower, undertook consultation on further cost-reflective pricing. The consultation focused on:

- Pricing approach after the phase-out of the Low Fixed Charge Tariff regulations
- Smart meter deployment plans, given our low penetration
- Future technology trials and our interest to participate e.g. Electric Vehicles and
- Removal of direct billing for Industrial customers

#### PRICING METHODOLOGY 2025-2026

In addition to this formal notification, Top Energy has engaged stakeholders through attendance at industry workshops (e.g. ENA Strategic Pricing Working Group, Joint Retailer and ENA workshop), informal discussions and face to face meeting with retailers. There were 20 retail brands with customers on the Top Energy network, this is unchanged since last year.

#### **Pricing Decisions**

The Statement of Corporate Intent (SCI) of the Top Energy Consumer Trust sets out the overall objectives of Top Energy Limited. Our Pricing objectives and strategy and align to this. Of relevance are:

- **D.** To operate in an environmentally sustainable manner, to be responsive to the social needs of our community and have a well-defined corporate governance system to support the long-term strategy
- E. To minimise the total delivered cost of electricity to our consumers

## 3.4. Pricing objectives

Top Energy has adopted the following six pricing objectives, informed by the above considerations:

- 1. Prices provide an adequate return to the shareholder within the restrictions of the Commerce Commission's price control regime.
- 2. Prices are economically efficient, transparent, and simple to understand, but also recognise the socioeconomic needs of consumers and the region.
- 3. Prices reflect a fair and efficient allocation of cost, regardless of actual volumes of electricity consumed.
- 4. Prices provide consumers with opportunities to reduce their charges where they are able to make changes in their usage of the network to reduce Top Energy's long run marginal costs.
- 5. Price stability and certainty is maintained by signaling changes in advance and by transitioning these changes over an appropriate timeframe to avoid price shock.
- 6. Prices do not differentiate urban and rural consumers.

These objectives are informed by the key considerations discussed in the previous section, including business considerations, consumer feedback, industry and regulatory guidance (in particular the Electricity Authority pricing principles).

Trade-off exists across these objectives which must be balanced. Our current focus in meeting these objectives is:

To allocate costs fairly between consumer groups

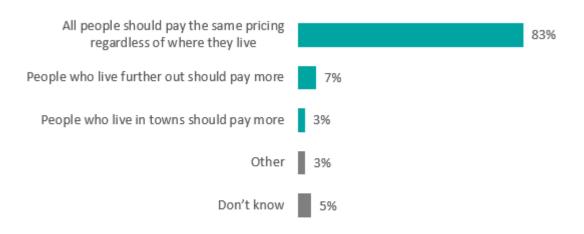

#### PRICING METHODOLOGY 2025-2026

- To establish a range of price options that reflect consumer requirements e.g. Residential and General Commercial TOU pricing.
- That prices reflect the potential demand and capacity required by consumers and are recovered in a cost reflective manner e.g. increase fixed charges.
- To comply with regulatory requirements
- To appropriately recover pass through costs
- To achieve a rate of return acceptable to shareholders.

These are reviewed periodically. The last change was made in 2023.

Top Energy surveyed its customers as a part of the annual consumer survey in 2022 to establish if consumers agreed with pricing principle 6 – Prices do not differentiate urban and rural customers. This was completed again in 2023 with similar results. The chart below shows our consumers strongly hold this view with more than eight out of ten customers (83%, up 2%) believe all people should pay the same pricing regardless of where they live and only approximately one in fifteen customers (7%, down 4%) would like people who live further out to pay more. Therefore, the objective will remain.

Figure 8: Survey results on locational pricing

## 3.5. Five-year pricing strategy and Roadmap

In 2022, the strategy and roadmap were reviewed and updated to reflect Top Energy's next steps in pricing reform and ongoing transition to efficient pricing. This has been further refined to align our pricing with the rural network scenario map outlined in the Authority's Distribution Pricing: Practice Note Second Edition v2.2, 2022, and the Authority's 10 areas of focus.

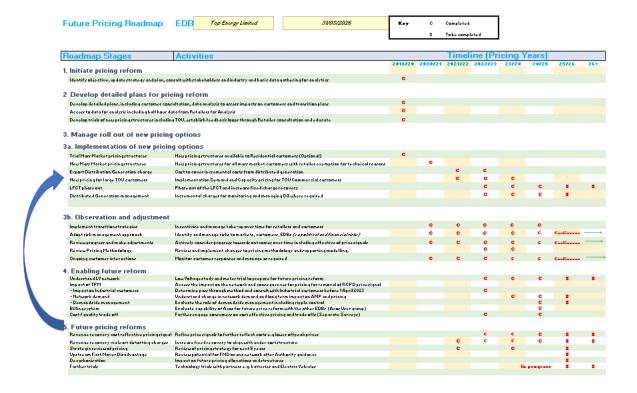

#### PRICING METHODOLOGY 2025-2026

All the key activities for 2024/2025 have been completed or are in progress. The fixed cost recovery strategy has been extended to incorporate the end of the LFCT regulations and the reset of DPP, published in November 2024. Top Energy's capital contributions policy (refer to section 7.11) avoids significant first-mover advantages. The Authority is currently consulting on capital contribution policies and processes, and we will review our capital contribution policy once a decision is published.

#### Roadmap

Top Energy's future pricing roadmap sets out how we will achieve our strategy and shows that significant progress has been achieved to date and includes multi-year activities which are interlinked and the key timelines.

Figure 10: Top Energy's future pricing roadmap (as of 31 March 2025)

#### Strategy

This is year 4 of our 5-year strategy, focusing on delivering the core objectives of efficient cost recovery, responses to current and future network congestion, and preparedness for emerging trends. Figure 8 outlines our progress to date and this year's focus areas.

A full strategy review will be completed next year, incorporating the LFCT phase-out, the Authority's ten areas of focus, capital contribution policy changes, and flexible distribution services.

#### Figure 8: Top Energy's pricing strategy

Our pricing strategy focuses on three key areas:

- 1. Efficient cost recovery
- 2. Responses to current and future network congestion
- 3. Preparedness for emerging trends

#### **Efficient cost recovery**

Costs are recovered in a manner that reflects the underlying costs to Top Energy, which are predominately fixed. Top Energy's strategy is to transition to fixed charges except where price signals are required while managing consumer impact and future signalling requirements for congestion. This has commenced, including increasing fixed cost recovery and reducing off-peak pricing signals, which continued this year.

The fixed cost recovery strategy, after the end of the LFCT, will be further defined after the DPP4 reset. A quantitative analysis that establishes a link between network conditions and peak signal strength has been included in section 7.3 Allocating price signals to consumer.

#### Responses to current and future network congestion

3.1.3 outlines the current constraints on our network. Despite experiencing limited network capacity constraints currently, Top Energy has introduced TOU pricing for Residential and Commercial consumers as we see congestion is sufficiently proximate.

Offering price signals now will enable retailers to build the appropriate systems, offer TOU price structures to customers, and become accustomed to these future price structures as peak demand is required. As constraints arise, price signals are expected to become more targeted.

#### PRICING METHODOLOGY 2025-2026

These price signals have become increasingly important with the removal peak transmission pricing (RCPD) and the removal of Avoided Cost of Transmission (ACOT) payments from 1 April 2023. Without these signals Distribution Generation in our network has no incentive to generate when demand is high e.g. winter nights and consumers will have less incentive to reduce demand. An analysis of the impact of these is in section 3.1.3.

#### Preparedness for emerging trends

Top Energy is aiming to address data and other constraints to assess current network capability and enable further pricing reform. This includes:

- An internal low-voltage physical study of the network to understand capacity and connectivity. The project
  has commenced and is expected to take 5 years. This will allow more capacity based fixed charge pricing.
- Negotiating access to low voltage network usage data, including demand and voltage, to understand real AMD. We have commenced a trial with a meter provider to understand the value of the data and functionality e.g. last grasp, load management
- Employing a dedicated Distribution System Operator to understand and manage:
  - Impacts of distributed generation on the network and associated costs. This includes distribution system operation and voltage flows.
  - Developing the role of demand management for managing the network and associated pricing implications.
  - Monitor EV uptake
- Surveying consumer's intentions and expectations.

The impact of electrification of large industrial processes is expected to be limited as only two Industrial customers are on our network. However, future work is required on upstream first-mover issues after the Authority's consultation on capital contribution pricing.

Top Energy acknowledges that there is further room to improve our existing pricing to signal future costs and respond to future network congestion. For example:

- 56% of revenue is recovered through variable (kWh) based prices, which does not align with our costs, which are largely fixed. Re-balancing of fixed and variable revenue recovery continues to be a key pricing reform and fixed cost recovery has increased this year.
- Our initial TOU pricing signals, if passed through, could be more targeted so they don't discourage
  consumers from using electricity during times where there is capacity available and does not drive additional
  network costs. This has started to be addressed through lower off-peak TOU prices.
- Further incorporation of new technologies and network alternatives.

These will continue to be addressed in the strategy review next year. Other mechanisms to manage maximum demand, when required, including ripple control will continue to be used in conjunction with pricing signals. The pricing strategy

#### PRICING METHODOLOGY 2025-2026

is one component of the wider strategy to manage our network assets and investment for the long-term benefit of our existing and future consumers.

Top Energy also acknowledges that pricing reform will be an ongoing process and has incorporated the development and modelling of further cost-reflective pricing, including new technologies, into the pricing strategy. This has been complemented by more consultation with retailers, including offering to be part of trials that retailers are considering operating.

## **Limitations on strategy**

Despite these efforts, there are still some barriers to achieving our strategy.

Despite a further 6,000 customers (20%) being migrated to network TOU pricing, there has been no material change in customer behaviour, as shown in Figure 9. This is due to a lack of pass-through by retailers, which has removed the pricing signals to end consumers.

With limited ability to influence Retailers to pass through line costs or install TOU meters, it does make further signalling through prices difficult. This could lead to inefficient network investment, which is not in the best long-term interest of consumers. We are working with other EDBs to explore future options e.g. EV pricing.

Figure 9: Consumption proportion by TOU time bands

Time band	2024	2023
Peak	19%	19%
Shoulder	55%	54%
Off-peak	27%	26%

Another key issue identified in implementing our price strategy is the roll out of smart meters to all our customers. Currently, only 76% of connections have smart meters installed. Our consultation with Retailers continues to push for further deployment of smart meters.

Figure 10: HHR Penetration based on Advanced Metering Flag

Density	Advanced Metering Penetration (%)
Remote	54%
Rural	73%
Urban	84%

#### PRICING METHODOLOGY 2025-2026

The availability of smart meters limits our ability to offer new pricing structures and for customers to potentially benefit. The concentration of non-smart meters in remote low-socioeconomic areas is of concern as our most vulnerable customers may not only be able to benefit but could also be negatively impacted as more network costs are allocated to those without smart metering.

## 3.6. Pricing review 2025/2026

Top Energy's pricing strategy has provided the framework for activity over the last few years and for the changes made this year. To assist in the delivery of the framework, Top Energy has continued to be a part of the ENA's Distribution Pricing Working Group (DPWG), to better understand and be involved in industry discussions on pricing and assist in industry alignment with the transition from a historical pricing structure. In addition, Top Energy and Northpower have continued to work closely together to delivery common pricing structures for Northland and adopt industry consistency where possible. This includes joint consultation of retailers, implementation, and analysis of TOU pricing for mass market customers and demand and/or capacity pricing structures for larger Commercial customers.

The main changes and activities to date are:

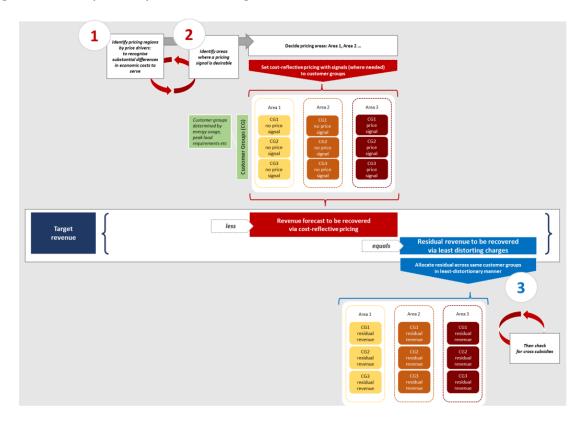

- Modernising the pricing structure to achieve better industry alignment e.g. ENAs distribution pricing
  guidelines, Residential consumer group with Low User and Standard User category and the introduction of
  TOU pricing for non-Residential customers.
- Evaluation of pricing options and potential impact on customers through analysis using customer half hour
  meter, updating our cost to serve model and focus group insights. The cost to serve modelled showed that,
  most customer groups covered the cost (excluding Return on Capital) of their supply of electricity. The main
  exceptions were Low User customers in rural areas across the network.
- Introduction of TOU pricing for Residential and General Commercial customers from 1 April 2020
- Introduction of capacity and demand pricing for TOU Commercial customers from 1 April 2021
- Introduction of Distributed generation export charges to cover incremental costs from 1 April 2021
- Commence the phase out of the LFCT from 1 April 2022
- Pass through of the new Transmission Pricing methodology from 1 April 2023
- Increased recovery of costs through fixed charges ongoing
- Updated our cost to serve model in 2023.
- Migrating all eligible connections to TOU pricing with no exemptions on 1 April 2024.
- Basing peak prices on LRMC and commenced reducing off-peak rates

To better reflect the service, we provide and our underlying cost structure (i.e. network capacity) and assist in managing future network capacity constraints, Top Energy has commenced implementing new more cost reflective pricing signals with the objective of moving from largely consumption-based pricing towards prices based on demand/capacity-

#### PRICING METHODOLOGY 2025-2026

utilisation with time of use consumption charges. This change is in line with the cost reflective framework that the EA has released for consultation in its Updated Practical Notes (2022).

Figure 11: Electricity Authority Practical note diagram

After significant changes over the last few years, there are no changes to pricing structures this year. The focus is on improving efficiency under the current structures. This year, the phase-in of lower off-peak prices and increased fixed cost recovery continues. Our fixed cost recovery strategy will be further refined to align with the phase-out of the LFCT regulations.

There are three key pricing focus areas this year, and these are shown in Figure 12:

Figure 12: Key pricing focus for 2025-26

Strategic driver	Explanation	Actions
LFCT regulations phase-out	Increase fixed charge recovery to be more cost reflective.	Increase Residential daily charge to 75c/day.

## PRICING METHODOLOGY 2025-2026

Consistent billing	All customers billed through retailers	No longer direct bill Industrial customers
More cost reflective pricing	Continuation of our move to cost reflective pricing by increasing fixed proportion of consumers charges and lower off-peak charges where constraints do not exist.	Continued increase in fixed cost recovery and reducing off-peak price signals through a phased approach to manage rate shock.

# 4. Target revenue

The first step in the pricing process is establishing the total target revenue to be recovered through prices. Distribution prices are set to generate sufficient revenue for Top Energy to recover its costs, subject to DPP allowable revenues. These costs are discussed in further detail:

COMPONENTS OF TARGETED REVENUE						
	(1 April 2025 to 31 March 2026)	(1 April 2024 to 31 March 2025)	% change			
Transpower Charges	8,313,862	7,083,374	17.4%			
Avoided Cost of Transmission (ACOT)	-	-				
Other Pass-through Costs	377,519	386,403	-2.3%			
Other Recoverable Costs	- 5,916,825	- 567,029	943.5%			
Pass Through subtotal	2,774,556	6,902,748	-59.8%			
		-				
Network Maintenance Costs**	10,252,834	9,011,000	13.8%			
Overheads**	20,114,000	18,838,000	6.8%			
Depreciation	15,279,000	13,946,000	9.6%			
Pre tax ROI charge	31,575,992	19,897,166	58.7%			
Distribution subtotal	77,221,826	61,692,166	25.2%			
Annual Revenue Requirement	79,996,382	68,594,914	16.6%			
DPP Compliance Adjustment	- 25,776,276	- 21,568,569	19.5%			
OTAL TARGET REVENUE	54,220,106	47,026,345	15.3%			

<sup>\*\*</sup> Network Maintenance costs and Overheads for YE2025 have been updated to match the latest AMP (2024 Report)

The total Target revenue has increased by \$7.2m (15.3%).

## 4.1. Revenue cap regulation

Top Energy's revenue under the 2025 Default Price Path (DPP) Determination is based on a revenue cap. Total target revenue for 2025-2026 is \$54.22m complying with the default price path (DPP) and based on consumption and connections forecasts. This is \$0.2m below the Forecast Allowable Revenue of \$54.47. The methodology for forecasting consumption and connections is outlined in Top Energy Annual Price-Setting Compliance Statement – 2026 Assessment period. The target revenue is after any posted line charge discounts that are paid to consumers through a reduction in their electricity bill. Posted discounts are forecast to be in the vicinity of \$5.9m for the year, representing 11% of target revenue before the discount.

#### PRICING METHODOLOGY 2025-2026

For the 2025-26 year, revenue has increased by 15% (\$7.1m). Even though revenue has increased by \$7.1m, Top Energy is under recovering revenue by \$11.1M as it has set the washup draw down amount at \$0 rather the maximum allowed which is \$11.1M1..The allowable return on investment for the 2025-26 regulatory period is 7.1% (65th percentile vanilla Weighted Average Cost of Capital (WACC).

## 4.2. Transpower charges

From 1 April 2025, Transmission has been reclassified as a pass-through rather than a recovery cost. Top Energy passes through all transmission charges at cost in accordance with the DPP and its own pricing principles. From 1 April 2023 Transpower has implemented a new Transmission Pricing Methodology (TPM). The key aspect of the new TPM is a benefit-based approach. The EA states "Those who benefit from Transmission will pay for them, through fixed like charges". The new TPM has three charges:

- Connection Charges Transpower charges for use of Kaikohe GXP connection assets to which Top Energy's network connects to the national grid. This is relatively unchanged.
- Benefits Based charges (BBC) allocates the cost of new and certain historical grid investments to consumers in proportion to their benefits
- Residual charge recovers Transpower's remaining costs that are not recovered through other charges.

In addition, there is also a transition cap to manage price shock. This is only an interim charge. In 2024-2025, our BBI charges were recalculated based on a new connection that met the >10MW reopener criteria. The incremental change was passed through to the new connection.

Top Energy has used the following methodology to allocate Transmission costs to consumer groups. These allocators are in line with the EA's guidelines that allocators should be "fixed like" and not materially impacted by customers future behaviour. Top Energy will charge this as a fixed costs in line with the EA guidance. The phase in was completed last year.

Figure 14: TPM allocation and pass-through methodology

Charge Type	Basis of Costs	Transpower allocator	Charged by Transpower	Allocation by Top Energy to Pricing Groups	Top Energy Long-term Charging Methodology
Connection Charges	Connection Investments	Primary: Connection Secondary: AMD/AMI	Fixed	Lagged coincidental AMD (3 years) as a proxy for capacity then lagged kWh for Residential and Small Commercial	Fixed
Benefits Based	Interconnection Assets	Primary: Regional benefit Secondary: GXP Average kWh	Fixed	<\$20M TPM simple allocation method updated every 5 years >20M historical kWh (2014-2018)	Fixed
Residual	Remaining recoverable revenue	Primary: Historical average AMD Secondary: Historical Average kWh Tertiary: Lagged system average kWh	Fixed	Match Transpower methodology	Fixed
Transitional Cap	Transition management	See TPM	Fixed	Same as connection given only \$20k	Fixed

#### PRICING METHODOLOGY 2025-2026

## 4.3. Avoided Transmission – Distributed Generation

From 1 April 2023, the Authority has decided that payments by distributors to eligible distributed generation for avoided cost of transmission (ACOT) are no longer required.

## 4.4. Avoided Distribution – Distributed Generation

Avoided distribution may be payable to embedded generators of greater than 1MW output when suitable terms have been negotiated with Top Energy.

## 4.5. Other Pass-through costs

This includes rates and regulatory levies.

#### 4.6. Other recoverable costs

This includes quality incentive and Incremental rolling incentive scheme (IRIS) adjustments.

## 4.7. Network costs

Network costs comprise mainly maintenance costs. These are derived from the network maintenance programme which provides consumers with acceptable levels of safety and reliability, including an allowance for repairs following faults. The amount is determined in conjunction with Top Energy's Asset Management Plan.

## 4.8. Non-Network costs

These are costs incurred in managing the day-to-day operations of the business, including management, finance and administration costs, as well as system operations and network support.

## 4.9. Depreciation

Depreciation represents the return of Top Energy's asset investment and is estimated using 2024 Regulatory Asset Base (RAB) roll-forward.

## 4.10. Pre-Tax WACC

A pre-tax return on investment is derived by applying a pre-tax weighed average cost (WACC) to Top Energy's regulatory asset base (RAB). Our 2026 WACC estimate of 8.37% is based on the DPP WACC (7.10%) expressed on a pre-tax basis.

# 5. Identify pricing regions and pricing signals

The second step in the pricing process is to identify pricing regions where there is a substantial difference in economic cost to serve. There are several ways in which pricing regions could be determined:

#### PRICING METHODOLOGY 2025-2026

- Split by GXP
- Connection types such as rural and urban
- Geographical regions

To assist in this process our Cost Serve was updated in 2023. This model investigated the merits of adopting pricing subregions, reflecting urban, rural and remote and Northern, Eastern and Western network supply areas, respectively. While some cost differences were evident across these regions, potentially justifying different prices, consumers have sent a clear message that rural and remote consumers should pay no more than urban areas (See Section 4 Pricing principles). This aligns with our pricing objectives that prices do not differentiate between Rural and Urban customers.

The third step is to consider areas were a target congestion-related pricing signal is desirable. The key areas of constraint on our network are set out in Appendix 6.

## Taipa substation

Taipa substation feeds 4,500 consumers and is operating at near capacity, with future growth predicted. The immediate growth in peak demand will be met through an existing distribution generation solution owned by Top Energy (4.5MW Diesel generation). Alternative solutions are being considered. This includes a battery trial with a third party. The battery (100kW) has been installed in 2024, and results will be analysed. The learnings so far have been meeting standards and comply with the conditions of the Electricity Industry Participation Code.

#### Kaitaia 110KV

The constraint on the Kaitaia 110kV is for large Distributed Generation. Currently, the approved applications of 67MVA consume the full export capacity of this line. Therefore, we will charge any further large DG connections the incremental costs to connect them under Part 6 of the Code. This is an extremely cost-reflective price signal.

As such, there are no areas on our network that require a targeted congestion-related signal for the coming year.

#### PRICING METHODOLOGY 2025-2026

# 6. Determining Consumer Groups and Pricing Options

The next stage is to determine Consumer groups and pricing options.

#### 6.1.Cost drivers

We have sought to align our consumer groups and pricing options to reflect differences in the key drivers of our costs. Approximately, 75% of our costs is associated with directly investing in, maintaining and operating the network, as well as receiving supply from Transpower. The remaining 25% is associated with general management and administration of the business. Top Energy considers that our network cost drivers are:

- peak demand
- the length of circuit required to supply consumers.
- the number of consumer connections
- dedicated asset costs.

The cost drivers that are relevant to Top Energy's current pricing methodology are peak demand, the number of connections, and dedicated asset costs, as discussed below.

#### **Peak demand**

Top Energy builds capacity in the network to meet forecast demand. As demand increases, Top Energy must consider further investments in capacity or alternatives. Consumers' peak usage of existing network capacity is a key driver of future costs. For instance, the network faced capacity constraints in some growth areas (as identified in 3.1 Business considerations) and Top Energy has undertaken a large investment programme in these areas to meet forecast demand. The introduction of TOU pricing and full migration of eligible connections may assist in deferring future investment once these signals have been passed through to customers by retailers.

#### **Circuit length**

The distance between a consumer's premises and the point of supply to the network influences the length of lines and cables required to deliver electricity to consumers. Thus, consumers further away from the Kaikohe GXP create relatively higher costs for Top Energy.

In our view, it is not practical, or necessarily fair, to distinguish individual consumers by circuit length. However, groups of consumers within network sub-regions can be distinguished, as noted in section 2. Given the clear message from consumers that rural and remote consumers should pay no more than urban areas, Top Energy has decided not to reflect this in pricing other than for Industrial customers.

#### PRICING METHODOLOGY 2025-2026

#### **Consumer connections**

New connections create investment and ongoing operations and maintenance costs. Top Energy's policy is for consumers to contribute towards capital costs in an upfront capital contribution. Remaining connection related costs must therefore be recovered through pricing. This will be reviewed after the Authority's final decision from their review.

#### **Consumer specific costs**

As a general principle, costs that are specific to individual consumers or groups of consumers should be directly recovered from these consumers, where practical. Example of these include:

- The provision of street lighting and community lighting is an example of a cost only caused by a specific group.
- Transmission and asset costs for large industrial consumers can also be identified, and prices set to reflect these costs through non-standard contracts.
- Transformer capacity for larger commercial consumers.

## 6.2. Consumer Groupings

Primarily consumers connections are classified into Consumer Groups according to their capacity requirements and connection profiles. Capacity is seen as a good proxy for Consumer groups with similar peak demand and, therefore, incur similar network costs. With the removal of RCPD charges, these consumer groups will be reviewed. This will be part of the impacts of the new TPM workstream in the pricing strategy.

The number of Consumer Groups has been set at five reflecting that 99.5% of customer base is made up of mass market customers and the balance between minimising complexity and ensuring costs are allocated appropriately between consumers.

**Figure 15: Consumer Groups** 

Consumer Group	Criteria	Rationale	Pricing and commercial terms
Larger	Large Commercial and Industrial	Pricing incentivises the efficient use of network	
	loads, with a fuse capacity of	capacity by large loads through variable charges	Standard
	110kVa or greater	levied on peak, shoulder and off-peak time of use	31011001
		periods for Large Commercial and capacity charge	
		based on kVA installed.	
		Industrial loads are distinguished by much larger load	Non-Standard
		size, time of use metering and Transpower and Top	

#### PRICING METHODOLOGY 2025-2026

Residential	Loads have similar capacity with	Energy's distribution costs can be identified for each consumer.  Embedded networks are typically large loads and are distinguished by individualised requirements which are required to considered on a case-by-case basis  Recognises the large majority of small load	Non-Standard Standard
Residential	a common load profile which is often controllable	connections with or without access to time of use meters and providing compliance for low user regulations.	Stanuaru
General	All connections that do not fit within other consumer groups	Same pricing options as 'standard Residential' are available.  In addition, pricing incentives through General Advanced variable charges levied on peak, shoulder and off-peak TOU periods.  Also recognises that some connections will be without TOU meters.	Standard
Generation only <1MW	Connection which is less than <1MW and is a generation only	Ensure that connections whose sole purpose is generation only pay incremental costs. Note >1MW are individual priced	Standard
Unmetered	Street and community lighting and other unmetered connections	This group recognises the unique cost and network usage profile of street and community lighting.	Standard

## 6.3. Allocating price signals to consumer groups

The next step is to determine which consumer groups should receive a price signal and the strength of that signal to determine the revenue forecast to be recovered via price signalling.

## **Residential and Commercial**

• TOU Pricing signals are designed to recover costs that are or will be incurred if customers place more demand on the system. This is primarily driven by system growth.

#### PRICING METHODOLOGY 2025-2026

#### **System Growth**

We have used the existing capacity growth investment in our AMP to forecast our Long-Run Marginal Cost (LRMC) to build additional capacity into the network. This only reflects the cost to increase the capacity that our network can deliver and does not include new connections or subdivisions. LMRC has been chosen because networks are made up of long-term investments and is consistent with other networks which we work closely with e.g. Northpower.

Our LRMC is currently estimated to be \$193 per KVA. This has increased due to growth-related substation (Wairoa) and the 110 Transmission work being brought forward. This establishes a link between network conditions and the peak signal strength by deriving a peak differential.

The peak differential is calculated as:

$$Peak \ differential = \underbrace{Value \ of \ demand \ management \ (per \ annum) = 193}_{Peak \ hours \ per \ year} = \$0.15 \ per \ kWh$$

Where *Peak hours per peak day*  $\times$  *Peak days per year* (5  $\times$  250 = 1,250 hours)

Based on this calculation, the differential should be set at approximately 15c per kWh for our standard Residential and General Price categories. Given the change from last year, this will be phased in to manage customer impact.

## Large TOU commercial and Industrial customers

- Large commercial price signals are lower than Mass Market due to higher fixed cost recovery and higher usage. These will continue to be reviewed as we increase cost recovery through fixed costs.
- Industrial pricing aims to recover Top Energy's costs to service these consumers. It is fully fixed with no price signal, as any capacity growth requirements are directly charged to these customers.

## 6.4. Test for cross-subsidisation

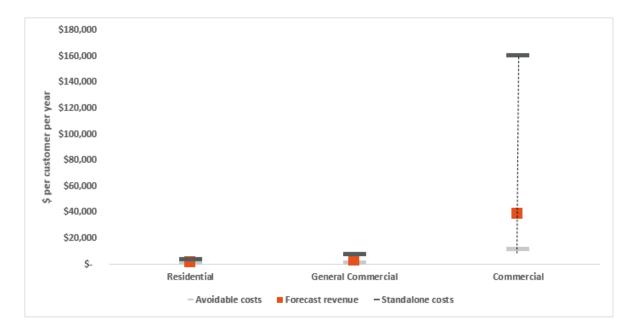

To help ensure the consumer groups are free from cross-subsidisation, we test whether revenue collected from prices is less than the stand-alone cost and greater than the avoidable cost (the cross-subsidy free range), for each consumer group.

**Avoidable cost:** are the additional costs of connecting a consumer, comprising connection costs, network upgrades, and incremental operating costs. Top Energy requires a capital contribution for new connections and asset upgrades if the expected line charge revenue from the connection is less than the associated incremental capital cost (i.e. an uneconomic connection). Accordingly, distribution prices will typically be in addition to incremental capital costs. Remaining incremental operating costs resulting from a new connection will be recovered through distribution prices. A new connection is estimated to contributed approximately \$400 per annum (real) to operating expenditure.

#### PRICING METHODOLOGY 2025-2026

**Standalone cost:** means the cost for a consumer to disconnect from the distribution network and install onsite generation. Solutions do exist for small loads to disconnect from the network through installation of onsite solar generation and batteries. However, these systems are relative expensive when compared to distribution supply. Given the geographic characteristics of our network these are calculated on an individual basis.

The graph below compares avoided costs, stand-alone costs and revenue from prices. Residential and General connections cover more than 99% of customers. This shows the revenue is within the subsidy-free range established by stand-alone and avoidable costs. Industrials are priced individually on a cost basis.

For example, a 7kW solar system, 15kW battery system with diesel generator can cost around \$40,000 to install. We estimate this would cost 65 c/kWh over a 15-year period and the installation is funded by a mortgage. This is lower than last year however is significantly more expensive than the average 44.2c/kWh charge Top Energy's consumers pay (source: MBIE quarterly survey of electricity prices, 15 August 2024). Top Energy will continue to keep a watch on this market and respond appropriately through pricing.

## PRICING METHODOLOGY 2025-2026

# 6.5. Summary of pricing options

Top Energy offer the following pricing options within the above consumer groups.

Figure 16: Pricing Options

Price Code	Description and rationale			MWh	ICPs
Industrial	Fixed price recovery of costs associated with industrial loads consuming >3,000,000kWh per annum and a fuse capacity of 110kVa or greater.			39,765	3
Large Generation (LDG)	Fixed price recovery of costs associated with the connection of large-scale distributed generation into the distribution network.				4
Generation <1MW	Costs set only to recover incremental costs.				
Micro Generation (DG)	Variable price recovery of costs associated with the connection of small-scale distributed generation into the distribution network. This is set at 1c/kWh			7,683	
General Advanced Metering (TOU) and (GA)	TOU is the default code for all customers with 110kVA connection or greater and typically have an annual consumption appropriately of 275,000kWh but less than 3,000,000kWh (TOU). Total charges for this plan include a fixed price for each day connected, a connection charge for installed capacity on a kVA per day and a variable consumption price based on kWh consumption during three pricing periods, representing peak, shoulder and off-peak demand periods, as follows:  GA Advanced metering is for small Commercial connections with pricing beneficial for customers using between 45,000 and 275,000 kWh (GA) per annum depending on capacity.  Both have pricing in the following time periods.  Peak: 07:00-9:30 and 17:30-20:00 Shoulder: 09:30-17:30 and 20:00-22:00 Off-peak: 22:00-07:00			44,201	107
Residential	Residential ICP's can have the following metering configurations: Uncontrolled, All inclusive and Controlled.  Meter configuration Total usage (MWh)			157,921	28,718
	Uncontrolled  All Inclusive	40,132 117,508			
	Controlled	281			
	Total	157,921			

### PRICING METHODOLOGY 2025-2026

#### Where:

**Uncontrolled (UN24):** This plan includes a fixed price for each day connected and a variable consumption price based on kWh consumption during three pricing periods, representing peak, shoulder and off-peak demand periods, as follows:

Weekdays (excluding weekends and public holidays)

Peak: 07:00-9:30 and 17:30-20:00

Shoulder: 09:30-17:30 and 20:00-22:00

Off-peak: 22:00-07:00

### Weekends and public holidays

Shoulder: 07:00 - 22:00Off-peak: 22:00 - 07:00

A single price default option is available for customers with legacy meters or non-communicating smart meters as indicated by "N" in the AMI flag field of the Metering Attributes section in the EA registry. Variable prices are set higher than other controlled codes to incentivise consumers to take up controlled prices.

**All Inclusive (IN18):** This plan includes a fixed price for each day connected and a variable consumption price based on kWh consumption during three pricing periods, representing peak, shoulder and off-peak demand periods, as above. A single price default option is available for customers with legacy meters or non-communicating smart meters as indicated by "N" in the AMI flag field of the Metering Attributes section in the EA registry. This requires that Top Energy can control load for up to 6 hours per day. The load offered must be at least 3 kW (e.g. a hot water cylinder). Variable prices are set higher than other controlled codes as the supply is a single meter and therefore it is not possible to determine the actual portion of controlled and uncontrolled load.

**Controlled 20 (CN):** Top Energy can control load for up to 4 hrs per day and the load offered must be at least 10 kW. This is available to customers in conjunction with other configurations. Prices are lower than under the UN and IN price options to encourage consumers to offer up large interruptible loads.

### PRICING METHODOLOGY 2025-2026

				82,118	5,575
	Meter configuration	Total usage (MWh)			
	Uncontrolled	68,624			
	All Inclusive	11,609

UM	Prices for streetlights (UML) are (UMG) are supplied with continu		p equivalent. Other connections tts. Prices are wholly fixed.	1,130	2,519

## 6.6. Industrial (Non-Standard)

Industrial pricing aims to recover Top Energy's costs to service these consumers. To meet these consumers' requirements, Top Energy charge a wholly fixed annual price divided into twelve equal payments. There is no variable component. This fixed charge comprises the following individual charge items:

- Transpower charges which include Connection charges, Benefits based charges, Residual charge and
   Transition Charge
- Avoided distribution charges payable to embedded generators if applicable
- Top Energy connection and interconnection charges for its sub-transmission assets
- Top Energy operations and maintenance charges

The charges have been calculated consistent with network cost drivers on the basis of:

- Asset usage (e.g. no low voltage or distribution level costs are assigned to these consumers as they connect directly to the sub-transmission system)
- Transmission methodology outlined in section 5.2.

Top Energy has introduced non-standard pricing for specific regional development initiatives e.g. Ngawha Innovation Park and may introduce non-standard pricing for new embedded networks depending on its characteristics.

### PRICING METHODOLOGY 2025-2026

## 6.7.TOU and General Advanced Metering

Pricing comprises of a fixed, capacity for TOU and variable component. Fixed prices have been set to maintain historical linkages, reduce stranding risk associated with larger connections, as well as reflect the proportion of asset used compared to other pricing options. Capacity prices reflect the individual assets used by customers and will be phased in over time to reflect the underlying related costs.

Variable rates are set relatively higher during periods of peak demand and progressively lower during shoulder and offpeak demand periods. These time periods have been designed:

- To align with typical demand periods on the network
- To incentivise consumers to shift demand from peak periods to shoulder periods and from shoulder to off-peak periods.
- To maintain consistency with industry standard TOU periods

## 6.8.Residential/General

Pricing comprises of a daily fixed and variable component. A daily fixed price is levied on these plans as follows:

- a 75 cent per day is applied to all Residential consumers who meet the criteria of being a low user (LR)
  to comply with the low user fixed charge regulations and the Retailer has requested the low user (LR)
  code.
- A \$2.375 per day is applied to all Residential consumers who do not meet the low user criteria.
- A \$3.00 per day is applied to all other consumers who are not Residential.

The increase in the daily fixed charge for the Low Users continues Top Energy's strategy to move towards more cost reflective pricing however this is limited by the low fixed charge regulations phase out timeline. Variable rates are set relatively higher during periods of peak demand and progressively lower during shoulder and off-peak demand periods. Discounts to the standard Uncontrolled price are applied to Controlled plans (All Inclusive and Controlled 20), to incentivise consumers to offer up controllable load.

## 6.9.Unmetered

Unmetered pricing is wholly fixed. Fixed charges have historically been set with reference to historical amounts and have not changed in recent years.

## 6.10.Distributed generation

Under Part 6 of the Electricity Industry Participation Code, Top Energy must price distributed generation at no more than the incremental cost of connecting this generation, taking into account any avoided costs.

#### PRICING METHODOLOGY 2025-2026

Top Energy has developed separate charges for distributed generation based on c/kWh exported to the grid. These charges only cover incremental cost directly associated with distributed generation and apply to all customers except generators. For large scale generators (>1MW) Top Energy has negotiated avoided transmission, avoided distribution and voltage support payments. This is dependent on these generators being able to demonstrate on an annual basis that they are making a material contribution towards Top Energy avoiding additional transmission costs.

## Existing large-scale distributed generation (>1MW)

Connection charges have been set to recover the costs through a non-standard contract. From 1 April 2022 a new charge was introduced for distributed generation >1MW to cover incremental costs to actively manage and monitor power flows in areas where congestion occurs. Initially this will be set at zero as no distributed generation >1MW requiring monitoring and management has been connected to date. Direct cost associated with Transmission Connection charges will also be recovered.

### Other distributed generation

Top Energy considers that other distributed generation customers with load (e.g. small-scale solar PV) already receive a significant benefit through reduced distribution consumption prices, to the extent that electricity generated on site reduces the amount of electricity delivered via the network. Conversely, the cost to Top Energy of servicing these connections (i.e. an average domestic connection) is not reduced by the presence of the distributed generation, especially if the connection requires access to the network at times of peak demand. Accordingly, we believe that some connections with distributed generation are paying less than the incremental cost of providing the connection to that consumer.

The introduction of a distributed generation based on c/kWh exported to the grid, the planned move to demand / capacity pricing and a higher proportion of fixed charges will ensure that consumers with distributed generation pay a fair share of costs, to satisfy cost recovery and fairness considerations under Top Energy pricing objectives.

## 6.11.Discounts

The discount will continue to be posted and will be based on consumption from 1 April 2025 to 31 March 2026, which covers the entire assessment period. Discounts calculated on this basis represent approximately \$5.9m and will be processed through the retailers to be applied to consumer invoices after the 31 March 2026.

## 6.12. Capital contributions

A customer may be required to make an upfront contribution to the cost of extending or upgrading the network (e.g. arising from connecting to the network). This contribution pre-funds Top Energy's investment, with these costs excluded from line charges.

The value of the Capital Contribution is calculated from the total cost of extension work and reduced by the value of the Top Energy connection subsidy. The contribution represents the uneconomic cost of constructing the line but does

### PRICING METHODOLOGY 2025-2026

not grant any ownership rights; Top Energy retaining ownership, and responsibility for repairs and refurbishment of the reticulated extension.

Capital Contributions may be non-refundable or refundable depending on the circumstances. A refund may be applicable should a new customer connect to the Network extension within a 5-year period from the date of payment by the applicant that made the original contribution. This assists in addressing the First Mover disadvantage issue. Standard charges and requirements apply to typical connection configurations.

The full details of the methodology for determining capital contributions are publicly disclosed on the website <a href="https://www.topenergy.co.nz/network/network-disclosures/">www.topenergy.co.nz/network/network-disclosures/</a>

# 7. Calculation of Prices and customer impact

Tariffs are calculated by allocating costs to consumer groups and prices, based on assumed splits between fixed and variable tariffs. Figure 17 summarises the allocators used to allocate target revenue and the rationale for these decisions.

Figure 17: Summary of cost allocators used to set prices

Cost Category	Allocator used	Rationale
Transmission costs	Connection Charge and Transition charges:  3-year Lagged AMD as a proxy for Capacity	Connection charges represent investment in GXP capacity. AMD broadly represents usage of this capacity.
	Benefits Based charges:  Project <20M: TPM Simple methodology  Project >\$20M; historical kWh (2014-2018)  Residual charges:  Historical average AMD (2014-2018) and  Historical average kWh (2017-2021)	Same as TPM Method  Aligns with Residual allocation and is fixed like allocator  Same as TPM calculation
Network Costs	Customer group demand on the system as a percentage of ORC	Spreads maintenance cost weighted by the replacement cost of assets (recognising higher maintenance is usually attributed to higher cost assets).

### PRICING METHODOLOGY 2025-2026

Non-Network Costs	Regulatory Asset Base (RAB)	Spreads costs that are relatively static with the size of a customer's <b>asset base</b> , <b>per feeder</b> .
Depreciation	IND: Demand (kW)  General Advanced: RAB  Residential/General/UM: RAB	Allocation based on utilisation of asset utilisation, which broadly corresponds with depreciation representing use of capital.
Pre-tax ROI	RAB	Allocates return in proportion to value of assets RAB, consistent with regulatory framework.

The above allocation approach results in the following allocations of target revenue to consumer groups.

Figure 18: Cost allocation results

				Pass thro	ugh \$000s			Distribution \$*00	10°s			Revenue	
Consumer Group	Regulatory Asset Base 2025(\$m)	Number of ICPs	Energy Consumption and export Forecast 2026 (GWh)	Transmission, Other Pass-through Costs 2026	Recoverable Costs 2026	Network Costs (Maintenance)	Non-Network Costs (Overheads )	Depreciation	Posted Discount	Pre tax WACC	Annual Revenue Requirement	DPP compliance Adjustment	Total 2026 Target Revenue

## PRICING METHODOLOGY 2025-2026

# Appendix 2 - Glossary

ACOT	Availed Cost of Transmission
ACOT	Avoided Cost of Transmission
ACOD	Avoided Cost of Distribution
AMD	Anytime Maximum Demand, which is defined as the average of the 12 highest off-
	take quantities for the customer at the connection location during the Capacity
	Measurement Period.
Capacity	12-month period starting 1 September and ending 31 August inclusive, immediately
Measurement Period	prior to the commencement of the pricing year.
Consumer	A purchaser of electricity from the Retailer where the electricity is delivered via the
	distribution network and is interchangeable with customer.
Consumption Data	Data provided by the Retailer to the Distributor as required under the Use of System
	Agreement, showing details of the measured electricity consumption on the
	distribution network.
Code	The Electricity Industry Participation Code 2010.
Demand	The rate of expending electrical energy expressed in kilowatts (kW) or kilovolt
	amperes (kVA).
Distributor	Top Energy as the operator and owner of the distribution network.
Distributed	Electricity generation that is connected and distributed within the distribution
Generation (DG)	network, the electricity generation being such that it can be used to avoid or reduce
	transmission demand costs.
ENA	Electricity Networks Association
GXP	Grid Exit Point, a point of connection between Transpower's transmission system
	and Top Energy's distribution network.
GST	Goods and Services Tax as defined in the Goods and Services Tax Act 1985.
HV	High Voltage, voltage above 1,000 volts.
ICP	Installation Control Point. Point of Connection on the Distributor's network, which
	the Distributor nominates as the point at which a Retailer is deemed to supply
	electricity to a Consumer.
IND	Industrial Customer defined by Top Energy.
Installed Capacity	The capacity of each customer's connection to the Top Energy Network charged
	based on the capacity recorded by the Network in the Registry as at the end of the
	month.
	Low Voltage: Fuse capacity

	Transformer: Transformer capacity
Line Prices	The prices levied by Top Energy on Consumers for the use of the Network as
	described in this Pricing Methodology.
Load Control	The equipment (which may include, but is not limited to, ripple receivers and relays)
Equipment	which is from time to time installed in a consumer's premises for the purpose of
	receiving load management service signals.
LV	Low voltage. Voltage up to 1,000 volts, generally 230 or 400 volts for supply to most
	Consumers.
Pricing Year	12-month period from 1 April to 31 March the following year.
Retailer	The supplier of electricity to Consumers with installations connected to the
	distribution network.
ToU	Time of Use Customer, who is metered according to their electricity consumption
	for a particular period (usually half-hourly).
TPM	Transmission Pricing Methodology
Transpower	Transpower (NZ) Limited
UN	Uncontrolled

### PRICING METHODOLOGY 2025-2026

# Appendix 3 – Compliance with ID determination

ID Clause	Information Disclosure requirement	Pricing Methodology Reference
2.4.1	Every EDB must publicly disclose, before the start of each disclosure year, a pricing methodology which:	This Pricing Methodology will be published on our website prior to 1 April 2025.
2.4.1(1)	Describes the methodology, in accordance with clause 2.4.3 below, used to calculate the prices payable or to be payable;	See below for document references to compliance against clause 2.4.3.
2.4.1(2)	Describes any changes in prices and target revenues;	Prices after the discount have increased when comparing 2025 and 2026 pricing schedules. See section 2.3.  Changes in target revenues are described in Section 4.
2.4.1(3)	Explains, in accordance with clause 2.4.5 below, the approach taken with respect to pricing in non-standard contracts and distributed generation (if any);	See section 6.6 and 6.10
2.4.1(4)	Explains whether, and if so how, the EDB has sought the views of consumers, including their expectations in terms of price and quality, and reflected those views in calculating the prices payable or to be payable. If the EDB has not sought the views of consumers, the reasons for not doing so must be disclosed.	Public consultation was completed during 2024 (see section 3.2)

2.4.2	Any change in the pricing methodology or adoption of a different pricing methodology, must be publicly disclosed at least 20 working days before prices determined in accordance with the change or the different pricing methodology take effect.	Any changes were disclosed by 1 March 2025.
2.4.3	Every disclosure under clause 2.4.1 above must-	
2.4.3(1)	Include sufficient information and commentary to enable interested persons to understand how prices were set for each consumer group, including the assumptions and statistics used to determine prices for each consumer group;	Top Energy considers this document provides sufficient information on how prices have been set but will continually review for improvements.
2.4.3(2)	Demonstrate the extent to which the pricing methodology is consistent with the pricing principles and explain the reasons for any inconsistency between the pricing methodology and the pricing principles;	See Appendix 4  TEL considers our pricing is broadly consistent with the pricing principles, but we also discuss how potential changes to our pricing methodology will align more closely with these principles.
2.4.3(3)	State the target revenue expected to be collected for the disclosure year to which the pricing methodology applies;	See section 4.
2.4.3(4)	Where applicable, identify the key components of target revenue required to cover the costs and return on investment associated with the EDB's provision of electricity lines services. Disclosure must include the numerical value of each of the components;	See section 4.

2.4.3(5)	State the consumer groups for whom prices have been set, and describe-	See Section 6.5.
	<ul> <li>the rationale for grouping consumers in this way;</li> <li>the method and the criteria used by the EDB to allocate consumers to each of the consumer groups;</li> </ul>	
2.4.3(6)	If prices have changed from prices disclosed for the immediately preceding disclosure year, explain the reasons for changes, and quantify the difference in respect of each of those reasons;	See section 2.3 and Appendix 5
2.4.3(7)	Where applicable, describe the method used by the EDB to allocate the target revenue among consumer groups, including the numerical values of the target revenue allocated to each consumer group, and the rationale for allocating it in this way;	See tables in Section 7.
2.4.3(8)	State the proportion of target revenue (if applicable) that is collected through each price component as publicly disclosed under clause 2.4.18.	See tables in Section 7.
2.4.4	Every disclosure under clause 2.4.1 above must, if the EDB has a pricing strategy-	
2.4.4(1)	Explain the pricing strategy for the next 5 disclosure years (or as close to 5 years as the pricing strategy allows), including the current disclosure year for which prices are set;	Our pricing strategy is discussed in section 3.5
2.4.4(2)	Explain how and why prices for each consumer group are expected to change as a result	See section 3.5
2.4.5	Every disclosure under clause 2.4.1 above must-	

2.4.5(1)	Describe the approach to setting prices for non-standard contracts, including-	See Section 6.6 and appendix 5
(a), (b), (c)	• the extent of non-standard contract use, including the number of ICPs represented by non-standard	
	contracts and the value of target revenue expected to be collected from consumers subject to non-	
	standard contracts;	
	• how the EDB determines whether to use a non-standard contract, including any criteria used	
	• any specific criteria or methodology used for determining prices for consumers subject to non-standard	
	contracts and the extent to which these criteria or that methodology is consistent with the pricing	
	principles;	
2.4.5(2)	Describe the EDB's obligations and responsibilities (if any) to consumers subject to non-standard contracts in	See Section 6.6
	the event that the supply of electricity lines services to the consumer is interrupted. This description must	
	explain-	
	• the extent of the differences in the relevant terms between standard contracts and non-standard	
	contracts	
	• any implications of this approach for determining prices for consumers subject to non-standard	
	contracts.	

- 2.4.5(3) Describe the EDB's approach to developing prices for electricity distribution services provided to consumers See Section 6.10 that own distributed generation, including any payments made by the EDB to the owner of any distributed generation, and including the
  - prices; and
  - value, structure and rationale for any payments to the owner of the distributed generation.
- 2.9.1 Where an EDB is required to publicly disclose any information under clause 2.4.1, clause 2.6.1 and sub-clauses Completed and attached as Appendix 1 2.6.3(4) and 2.6.5(3), the EDB must at that time publicly disclose a certificate in the form set out in Schedule 17 in respect of that information, duly signed by 2 directors of the EDB.

# Appendix 4 – EA Pricing Principles and focus areas

# **Pricing principles** Extent to which pricing methodology is consistent with pricing principle (a) Prices are to signal the economic costs of service provision, including by: (i) being subsidy free (equal to or greater than See section 6.4 avoidable costs, and less than or equal to standalone costs (ii) reflecting the impacts of network use on Top Energy's primary service is to provide capacity in the distribution network. To further reflect the impact of economic costs network use on economic costs Top Energy has implemented Residential and General Commercial TOU pricing from 1 April 2020 (which are mandatory with no exemptions) and demand/capacity for larger Commercial customers from 1 April 2021. This aligns pricing more closely with the impacts of network use on economic costs. In addition to the changes above, current pricing structures recognise the differences in network services provided to (or by) customers as follows: Consumer groups recognise different load sizes. Many network and transmission related costs are allocated to consumer groups in proportion to demand. Capital contributions help fund the uneconomic proportion of new investments in capacity.

	<ul> <li>Industrial sites (IND) are charged for specific asset usage and therefore the capacity these assets provide and are apportioned transmission charges.</li> <li>TOU/Advanced Metering structures encourage consumers to optimise the usage of the network across all time periods.</li> <li>Controlled prices encourage consumers to offer up controllable load which Top Energy can use to manage</li> </ul>
(iii) reflecting differences in network services provided to (or by) consumers and	congestion during interruptions to supply, when the network maybe constrained.  For the same reasons discussed above, Top Energy's pricing structures reflect differences in network services provided to (or by) customers. The introduction of TOU pricing for Residential and General Commercial customers
(iv) Encouraging efficient network alternatives	and demand and capacity for larger Commercial customers have improved these signals.  Avoided transmission, avoided distribution and voltage support charges may be payable to embedded generators
(iv) Encouraging emolent network diternatives	of greater than 1MW output. This may help justify investments in local generation.  The introduction of TOU pricing for Residential and General Commercial customers provides better signals for investment in new technology e.g. electric vehicles, distributed generation and batteries. Further analysis has been included in our pricing strategy.

#### PRICING METHODOLOGY 2025-2026

shortfall should be made up by prices that least with a lower willingness to pay. distort network use

(b) Where prices that signal economic costs. This principle suggests that the short fall should be made up by prices which don't impact usage behaviour e.g. would under-recover target revenues, the higher fixed charges or that consumers with a higher willingness to pay should pay relatively more than consumers

> Top Energy has increased its standard daily charge for Residential and General Commercial since 2016 from \$0.15/day to \$2.375/day and \$3.00/day, respectively. However, this approach is limited by regulatory constraints e.g. Low Fixed Charge Tariff regulation as over 60% of Residential customers are on lower user charge of \$0.75/day. Top Energy considers pricing based on willingness to pay should be linked to the level of service provided. This is a common pricing practice in many competitive markets. For instance, the UN24 and CN20 pricing options give consumers a choice over whether heating loads are interrupted. Consumers that are unwilling to have supply interrupted pay relatively more than a customer that is willing to accept a slightly lower level of service. Similarly, consumers on TOU pricing options that do not want to shift load to off peak periods pay more for using electricity at time that suits them.

(c) Prices should be responsive to the requirements and circumstances of end users by allowing negotiation to:

Capital contributions and non-standard contracts provide a mechanism where a consumer can request assets that provide a higher level of service. The costs of specific assets are either recovered upfront through a capital contribution or within specific pricing. Consumers can also request alternative pricing structures under non-standard contracts to address their own risks (e.g. IND prices are wholly fixed).

(i) reflect the economic value of services and

#### PRICING METHODOLOGY 2025-2026

### (ii) enable price/quality trade-offs

(d) Development of prices should be transparent, and have regard to transaction costs, consumer impacts, and uptake incentives

The pricing strategy explained in this document provides stakeholders with an overview of Top Energy's plans for prices over the next several years. We plan to continue to consult with consumers and retailers to seek their feedback on any changes which will be incorporated into any pricing decisions.

Learnings from the TOU trial and retailer consultation enabled us to understand the transaction costs and operational policies for the implementation of TOU for Residential and General Commercial customers from 1 April 2020. The approach of the new TOU prices applying for all customers with automatic exemptions for non-communication meters e.g. legacy meters and retailer's ability to apply for exemptions due to operation issues reflect this. Exemptions were removed this year after retailers had sufficient time to manage operational issues. The TOU price differentials are being phased in over time to manage rate shock and reduce revenue risk. As important it will allow further modelling as more consumption information becomes available which will assist in getting the final price differentials more accurate.

The new demand and capacity pricing for large Commercial customers implemented on 1 April 2021 incorporated feedback from retailers with the initial focus on implementing new structures and operational policies. The price signal will be phased in over time to manage rate shock and depending on network constraint requirements.

Initial Focus areas	Extent to which pricing methodology is consistent with Focus areas
Distributors Roadmaps responding to future network congestions	We have actively considered the impacts of future congestion and set out time-limited plans for responding in our roadmap. See section 3 and Appendix 6.
Distributors response to any significant first mover disadvantages issues	Top Energy has a capital contribution policy which ensures for connection assets first movers are charged based on the cost required to supply them and that these first movers are rebated fairly if subsequent mover connects within a time limited. See sections 6.12. The Authority released consultation on capital connections contributions in November 2024.  Top Energy's next step is to work with the Authority and Industry to progress this.
The extent to which distributors are following the Authority's guidance on pass-through of new transmission changes	Top Energy has followed the Authority's guideline in the pass through. Where possible this matches the TPM methodology. See section 4.2 and 4.3
Whether distributors are increasing their use of fixed charges to match the phase-out path of the LFCT regulations	Top Energy has increased the fixed charge for low users by the maximum allowed under the phaseout regulations and intends to continue this over the 5 years. See section 3.5, 3.6 and Appendix 5.

Distributors avoiding or transitioning away	Top Energy does not charge non-direct billed customers based on AMD or similar. There is a demand charge for TOU (61
from recovery of costs that are fixed in	customers), but this is set at zero as there is no current congestion. Our 2 Industrial are allocated shared asset costs on
nature through use-based charges	their use of that asset.
New Focus areas	Extent to which pricing methodology is consistent with Focus areas
Allocate revenue transparently	Reviewed current revenue allocation as part of our cost to serve update in 2023. Have reviewed our pricing methodology
	to ensure transparency. Waiting for further guidance from the Authority.
Assign all ICPs to time-varying distribution	Completed on 1 April 2024. All eligible ICPs (6000) were assigned ToU tariffs. There were no exemptions. Periodically
tariffs (limited exemptions)	review ICPs on non-ToU tariffs to ensure that they meet the criteria.
Set peak rates on a measure of Long-Run Marginal Cost	Introduced in last year's prices. Further refinement and standardization with industry the focus going forward
Reduce off-peak prices and controlled rates	In progress. Higher price levels than other EDBs mean that the transition will be longer.
Follow up on AMP reporting on readiness for increase electrification	Completed by 31 August 2024

# Appendix 5 - Network Line Charges 2025 – 2026

# 2025/26 Electricity Price Schedule Effective from 1 April 2025. All prices exclude GST

### **KEY CHANGES**

From 1 April 2025, our prices will increase by 15% to replace aging equipment and infrastructure to ensure continued reliability. This increase is necessary due to significant in the Electricity (low fixed charge option) Amended Regulations 2021. infrastructure to ensure continued reliability. This increase is increased increased increases in the cost of materials needed to maintain and upgrade our network, increased in May, eligible consumers will receive a Top Energy Lines Discount of up to \$200 on

in the Electricity (low fixed charge option) Amended Regulations 2021.

their power bill.

We will continue to evaluate our annual price increases and do what we can to mitigate

Discounts will be applied by your Retailer on your first bill between 1 May 2026 and 31 May 2026.

# Appendix 6 – Current Constraints by Substation

Main Substation	Load Type	Utilisation of Installed Capacity (%)	Forecast Utilisation of Installed Capacity in 5 years (%)	Maximum Capacity	Implications
Kaikohe	Urban and Rural with a mix of Domestic, Commercial and Agricultural load. An Industrial Park being developed.	51%	54%	17 MVA Firm (n-1)	Future energy needs are anticipated to be within current capacity, subject to load locations.
Kawakawa	Urban and Rural with a mix of Domestic, Commercial and Agricultural load.	85%	88%	6.25 MVA Firm (n-1)	Operating near firm capacity in winter peak periods. Movement of Russell loads from Kawakawa Zone Sub to Haruru Zone Sub planned
Moerewa	Urban and Rural with a mix of Domestic, Commercial and Agricultural load. Static growth.	78%	78%	5 MVA Firm (n)	Future energy needs are anticipated to be within current capacity.
Waipapa	Urban and Rural with mainly Commercial, Industrial and Agricultural loads. Load is growing.	40%	54%	23 MVA Firm (n-1)	Future energy needs are anticipated to be within current capacity.
Omanaia	Urban and Rural with a mix of Domestic, Commercial and Agricultural load.	53%	55%	5 MVA (n)	Future energy needs are anticipated to be within current capacity.
Haruru	Urban and Rural with an industrial load centre. Increasing demand growth	30%	33%	23 MVA Firm (n-1)	Future energy needs are anticipated to be within current capacity.
Okahu Rd	Urban and Rural with a mix of Domestic, Commercial and Agricultural load. Static growth.	76%	56%	11.5 MVA Firm (n-1)	Future energy needs are anticipated to be within current capacity.
Taipa	Urban & Rural with Domestic, Commercial and Agricultural loads. Medium growth	93%	99%	6.25 MVA (n)	Requiring reinforcement and use of distributed generation. Battery trial underway with third party
Pukenui	Dominantly Rural with Domestic and agricultural loads. Slow growth.	37%	43%	5 MVA (n)	Future energy needs are anticipated to be within current capacity.
NPL	Urban and Rural with Domestic, Commercial, Agricultural & Industrial loads. Falling demand due to reduced output from our largest industrial customer	36%	36%	23 MVA Firm (n-1)	Future energy needs are anticipated to be within current capacity.

Kaitaia 110KV	Bulk Supply at 33kV. Supply to Okahu Rd, Taipa, Pukenui & NPL Zone Substations.	126%	139%	20 MVA (n-1)	Issue going forward is new distributed generation, not load. Second 110kV planned
Kaikohe 110kV	Bulk Supply at 33kV to Kaikohe, Kawakawa, Moerewa, Waipapa, Omanaia, Haruru, Kerikeri & Kaeo Zone Substations.	155%	157%	30 MVA Firm (n-1)	Planned reduction in Utilisation due to 33kV Load transfer (Mt Pokaka, Waipapa, Kerikeri, Kaeo Zone Substations) to Wiroa.
Mt Pokaka	Rural with Domestic, Agricultural, and Industrial loads.	54%	61%	5 MVA (n)	Future energy needs are anticipated to be within current capacity.
Kerikeri	Urban load with Domestic, Commercial & Industrial. Township Increasing demand.	33%	38%	23 MVA Firm (n-1)	Future energy needs are anticipated to be within current capacity.
Kaeo	Rural with Domestic, light commercial, light industrial loads & Agricultural loads.	36%	39%	10 MVA Firm	Future energy needs are anticipated to be within current capacity.
